

## Information on Transitions Lenses

Transitions lenses provide the most convenient way to enjoy better quality of vision every day. Most people need to move from indoors to outdoors and from sunny to overcast skies several times a day and this requires their eyes to adapt to changing light repeatedly, resulting in eye strain or fatigue. Transitions lenses are developed to perform as a convenient optimal solution to this problem.

Transitions lenses are everyday lenses that activate in the presence of UV light using cutting edge photochromic technology. They are clear indoors and at night, but darken automatically when outdoors in the presence of UV rays.

Transitions lenses can automatically and conveniently adjust their tint level as the UV exposure level changes. As a result, they can provide visual comfort, quality and convenient glare and UV protection. Furthermore, Transitions lenses are compatible with virtually all frames and a wide variety of lens materials and prescriptions.

Transitions lenses offer benefits for everyone, both old and young. But some groups of people may benefit more from Transitions lenses. Children and teenagers need more eye protection from UV rays since their eyes are not as developed. Active adults go out more frequently thus Transitions lenses can provide optimal protection. Other ideal candidates for Transitions lenses include individuals with sensitive eyes, individuals with certain medical conditions and people who have undergone recent eye surgery.
